STAT/MTHE 353: 2 – Order Statistics

If
$$f_{1...n}$$
 is the joint pdf of $X_{(1)}, \ldots, X_{(n)}$, then (with $h > 0$)

$$f_{1\dots n}(x_1,\dots,x_n) = \lim_{h \to 0} \frac{1}{h^n} \int_{x_i}^{x_i+h} \cdots \int_{x_n}^{x_n+h} f_{1\dots n}(t_1,\dots,t_n) dt_1 \cdots dt_n$$
$$= \lim_{h \to 0} \frac{1}{h^n} P(x_1 \le X_{(1)} \le x_1+h,\dots,x_n \le X_{(n)} \le x_n+h)$$

(true for any sufficiently well behaved pdf).

Clearly, we only need consider the case $x_1 < x_2 < \cdots < x_n$. (Why?) Let S_n denote the set of permutations of $\{1, \ldots, n\}$. Note that $|S_n| = n!$. Since X_1, \ldots, X_n are jointly continuous, the n! disjoint events

$$A_{\sigma} = \{X_{\sigma(1)} < X_{\sigma(2)} < \dots < X_{\sigma(n)}\}, \quad \sigma \in S_n$$

have total probability 1, i.e.,

STAT/MTHE 353: 2 - Order Statisti

$$P\bigg(\bigcup_{\sigma\in S_n} A_\sigma\bigg) = 1$$

Order Statistics

Let X_1, \ldots, X_n be jointly continuous random variables.

Definition The *k*th order statistic of X_1, \ldots, X_n is the *k*th smallest value of the X_i and denoted by $X_{(k)}$. Thus

$$X_{(1)} = \min(X_1, \dots, X_n), \qquad X_{(n)} = \max(X_1, \dots, X_n),$$

The vector $(X_{(1)}, \ldots, X_{(n)})$ is called the order statistics of (X_1, \ldots, X_n) .

• We will assume that X_1, \ldots, X_n are *independent and identically distributed* (i.i.d.) random variables. Thus their joint pdf is

$$f_{X_1,...,X_n}(x_1,...,x_n) = f(x_1)f(x_1)\cdots f(x_n)$$

where f is the *common* marginal pdf of the X_i .

• We will determine the joint pdf of $X_{(1)}, \ldots, X_{(n)}$.

Define the events

STAT/MTHE 353: 2 - Order Statistics

MTHE 353 2 - Order Statis

and

 $A = \{x_1 \le X_{(1)} \le x_1 + h, \dots, x_n \le X_{(n)} \le x_n + h\}$

$$B_{\sigma} = \{x_1 \le X_{\sigma(1)} \le x_1 + n, \dots, x_n \le X_{\sigma(n)} \le x_n + n\}$$

and note that $A\cap A_{\sigma}=B_{\sigma}$ if h>0 is small enough. Thus for such h

$$\begin{split} &P\big(x_1 \leq X_{(1)} \leq x_1 + h, \dots, x_n \leq X_{(n)} \leq x_n + h\big) \\ &= P(A) = \sum_{\sigma \in S_n} P\big(A \cap A_\sigma\big) = \sum_{\sigma \in S_n} P\big(B_\sigma\big) \\ &= \sum_{\sigma \in S_n} \prod_{i=1}^n P\big(x_i \leq X_{\sigma(i)} \leq x_i + h\big) \quad \text{(since the } X_i \text{ are independent)} \\ &= \sum_{\sigma \in S_n} \prod_{i=1}^n \Big[F_{X_{\sigma(i)}}(x_i + h) - F_{X_{\sigma(i)}}(x_i)\Big] \\ &= n! \prod_{i=1}^n \Big[F(x_i + h) - F(x_i)\Big] \quad (F \text{ is the common cdf of the } X_i) \end{split}$$

3 / 1

4 / 12

We obtain

$$f_{1...n}(x_1, ..., x_n)$$

$$= \lim_{h \to 0} \frac{1}{h^n} P(x_1 \le X_{(1)} \le x_1 + h, ..., x_n \le X_{(n)} \le x_n + h)$$

$$= \lim_{h \to 0} \frac{1}{h^n} n! \prod_{i=1}^n \left[F(x_i + h) - F(x_i) \right]$$

$$= n! \prod_{i=1}^n \lim_{h \to 0} \frac{F(x_i + h) - F(x_i)}{h}$$

$$= n! f(x_1) f(x_2) \cdots f(x_n).$$

In conclusion, the joint pdf of the order statistics $X_{(1)},\ldots,X_{(n)}$ is given by

$$f_{1...n}(x_1, \dots, x_n) = \begin{cases} n! f(x_1) f(x_2) \cdots f(x_n) & \text{ if } x_1 < x_2 < \dots < x_n, \\ 0 & \text{ otherwise.} \end{cases}$$

If we integrate out x_n first, we obtain

STAT/MTHE 353: 2 - Order Statistics

$$f_{1\cdots n-1}(x_1, \dots, x_{n-1}) = \int_{x_{n-1}}^{\infty} n! f(x_1) f(x_2) \cdots f(x_n) \, dx_1$$

= $n! f(x_1) \cdots f(x_{n-1}) (1 - F(x_{n-1}))$

Continuing with $x_{n-1}, x_{n-2}, \ldots, x_{r+1}$, we get for all $x_1 < \cdots < x_r$

$$f_{1\cdots r}(x_1, \dots, x_r) = n! f(x_1) \cdots f(x_r) \frac{\left(1 - F(x_r)\right)^{n-r}}{(n-r)!}$$

Integrating out $x_n, x_{n-1}, \ldots, x_{r+1}$ in $f_{k \cdots n}(x_k, \ldots, x_n)$ or $x_1, x_2, \ldots, x_{k-1}$ in $f_{1 \cdots r}(x_1, \ldots, x_r)$ we finally obtain for all $x_k < \cdots < x_r$

$$f_{k\cdots r}(x_k, \dots, x_r) = n! \frac{F(x_k)^{k-1}}{(k-1)!} f(x_k) \cdots f(x_r) \frac{\left(1 - F(x_r)\right)^{n-r}}{(n-r)!}$$

Marginal pdfs of order statistics

Notation: For k < r we let $f_{k \cdots r}(x_k \cdots x_r)$ denote the marginal jpdf of $X_{(k)}, \ldots, X_{(r)}$. Here we always assume $x_k < x_{k+1} < \cdots < x_r$; otherwise $f_{k \cdots r}(x_k \cdots x_r) = 0$.

"Integrating out" x_1 we get

$$f_{2\cdots n}(x_2, \dots, x_n) = \int_{-\infty}^{x_2} n! f(x_1) f(x_2) \cdots f(x_n) \, dx_1$$

= $n! F(x_2) f(x_2) \cdots f(x_n)$

Similarly,

$$f_{3\cdots n}(x_3, \dots, x_n) = \int_{-\infty}^{x_3} n! F(x_2) f(x_2) \cdots f(x_n) \, dx_2$$
$$= n! \frac{F(x_3)^2}{2} f(x_3) \cdots f(x_n)$$

Integrating out x_3, \ldots, x_{k-1} , we obtain in general for all $x_k < \cdots < x_n$

$$f_{k\cdots n}(x_k,\ldots,x_n) = n! \frac{F(x_k)^{k-1}}{(k-1)!} f(x_k) \cdots f(x_n)$$

Setting
$$r = k + 1$$
 we get for all $x_k < x_{k+1}$

STAT/MTHE 353: 2 - Order Statistics

$$f_{k,k+1}(x_k, x_{k+1}) = n! \frac{F(x_k)^{k-1}}{(k-1)!} f(x_k) f(x_{k+1}) \frac{\left(1 - F(x_{k+1})\right)^{n-k-1}}{(n-k-1)!}$$

From this we obtain the marginal pdf of $X_{(k)}$:

$$f_{k}(x_{k}) = n! \frac{F(x_{k})^{k-1}}{(k-1)!} f(x_{k}) \int_{x_{k}}^{\infty} f(x_{k+1}) \frac{\left(1 - F(x_{k+1})\right)^{n-k-1}}{(n-k-1)!} dx_{k+1}$$

$$= n! \frac{F(x_{k})^{k-1}}{(k-1)!} f(x_{k}) \left[-\frac{\left(1 - F(x_{k+1})\right)^{n-k}}{(n-k)!} \right]_{x_{k}}^{\infty}$$

$$= n! \frac{F(x_{k})^{k-1}}{(k-1)!} f(x_{k}) \frac{\left(1 - F(x_{k})\right)^{n-k}}{(n-k)!}$$

We obtained (Theorem 9.5 in text):

$$f_k(x) = \frac{n!}{(k-1)!(n-k)!} f(x) F(x)^{k-1} (1 - F(x))^{n-k}$$

STAT/MTHE 353: 2 - Order Statistics

Finally, if we integrate out x_{k+1}, \ldots, x_{r-1} in $f_{k\cdots r}$, then we obtain for all $x_k < x_r$ (Theorem 9.6):

$$f_{k,r}(x_k, x_r) = n! \frac{f(x_k)F(x_k)^{k-1}}{(k-1)!} \cdot \frac{\left(F(x_r) - F(x_k)\right)^{r-k-1}}{(r-k-1)!} \cdot \frac{f(x_r)\left(1 - F(x_r)\right)^{n-r}}{(n-r)!}$$

Special cases: minimum and maximum

From f_k with k = 1 we get the pdf of $X_{(1)} = \min(X_1, \ldots, X_n)$:

$$f_1(x) = nf(x)(1 - F(x))^{n-1}$$

For k = n we get the pdf of $X_{(n)} = \max(X_1, \ldots, X_n)$:

$$f_n(x) = nf(x)F(x)^{n-1}$$

Example: The i.i.d. random variables X_1, X_2, \ldots, X_n are often called a *random sample* from the common distribution of the X_i . The *range* of the random sample is $R = X_{(n)} - X_{(1)}$. Determine the pdf of R. Specialize to the case where $X_i \sim \text{Uniform}(0, 1)$.

Solution: ...

STAT/MTHE 353: 2 - Order Statistic

Application: Sample median

STAT/MTHE 353: 2 - Order Statistics

• The median of the distribution of a r.v. X is any value m such that

 $P(X \leq m) \geq \frac{1}{2} \quad \text{and} \quad P(X \geq m) \geq \frac{1}{2}.$

Equivalently, if F is the cdf of X,

$$F(m)\geq \frac{1}{2} \quad \text{and} \quad 1-F(m^-)\geq \frac{1}{2}.$$

• The sample median of the random sample X_1, \ldots, X_n from a continuous distribution is

$$M = \begin{cases} X_{\left(\frac{n+1}{2}\right)} & \text{if } n \text{ is odd} \\ \\ \frac{X_{\left(\frac{n}{2}\right)} + X_{\left(\frac{n+1}{2}\right)}}{2} & \text{if } n \text{ is even} \end{cases}$$

• The sample median is often taken to be an estimate of the median, and it is sometimes preferred to the sample mean $\frac{1}{n}\sum_{i=1}^{n}X_{i}$ as an estimate of the "center of the distribution" because it is more robust to "outliers."

Example: ...
